Conclusions

...but only few discover it in schools!

- informatics == computer/applications literacy
- learn it because it helps you in finding a job
- the fun is normally associated to specific entertaining uses of computers (games, social networks, etc), not the discipline and its challenges

Instead, we know it's fun:

"I think that it's extraordinarily important that we in computer science keep fun in computing. When it started out, it was an awful lot of fun." [Alan Perlis]

How to show it to young people?

Why misperceived?

Conclusions

Main problem: What is the role of computers (and applications) in informatics (computer science)?

"Computer science is no more about computers than astronomy is about telescopes." [Dijkstra, 1986]

"The term computer science is as descriptive as the etymology of the word geometry" [Abelson, 1987]

Among experts the answer is rather clear: computer science is not (or not only) the science of computers, but rather the science of computing (for this reason the name Informatics is preferred, at least in Europe).

In fact, informatics is a **multi-faceted discipline** seen in three radically different ways when taught in school:

- 1 as a **science**, with its own peculiar approach to problem solving

- 1 as a **science**, with its own peculiar approach to problem solving
- 2 as a **technology**, producing hardware and software tools
- 3 as an **instrument**, to work on problems arising in all contexts

But the general public has a reductive perception of informatics as the mere ability to master a set of applications or communication tools!

Conclusions

A formative subject

Kangourou
informatics

M. Monga

We actually believe informatics is a very formative discipline,
not just for a specialist audience.

- abstraction
- algorithmic thinking
- structured problem solving
- computation with constraints on the resources (time and space)
- learn about how we learn (S. Papert)

Conclusions

In 2008 we were contacted by “Kangourou Italia” who organized the Kangourou of Mathematics with another department of our University.

Kangourous are a lot of fun. . . why not organize one focused on Informatics?

- The Kangourou has received many awards for its contribution to the promotion of mathematics among young people.
- K. of Mathematics engages about 50'000 primary and secondary school pupils in Italy
- The contest is the opportunity for distributing pleasant documentation to pupils and teachers.

Kangourou vs. Olympiads

Kangourou of
informatics

Qualifying round
Final round

Conclusions

Olympiads *citius, altius, fortius*... the quest for excellence;
pupils are engaged in a rather specialized training

Kangourou Promote the interest in the discipline among
young people (and teachers) even if informatics is
not their major topic

K. doesn't assume any specialized knowledge (programming
languages, data structures, etc.). In fact, we have goals similar
to Beaver's (that we didn't know when we started).

The goals

informatics

Qualifying round
Final round

Conclusions

The game-contest should stimulate pupils with regard to basic concepts:

- the description of unambiguous computing processes (*syntax and semantics*);
- the composition of complex objects from simpler elements (*abstraction and composition*);
- the analysis of the properties of computing processes (*complexity and computability*);
- the knowledge necessary not to uncritically accept the overwhelming technical jargon.

We identified three main obstacles:

- ① the abstract nature of computing
- ② the use of specialized language and terms
- ③ the risk of disappointment, since pupils expect computers

The Kangourou of informatics

Kangourou
informatics

M. Monga

Our assumptions

- No specific technical knowledge about programming languages or other formalisms for the representation of algorithms
- Logical, problem solving, and information coding abilities, as stemming from their mathematical background
- We expect some terminology is recognized as common jargon (bit, password, etc.) but not necessarily understood in its proper meaning

of informatics

Promoting
through
contests

Kangourou of
informatics

Qualifying round
Final round

Conclusions

- A **team** (4 pupils) contest
- Two categories: “Medie” (grades 6–8) and “Biennio” (grades 9–10)
- **Two phases**: a preliminary game (played in the schools) followed by a national final for the best 24 teams (max 1 per school)
- Multiple choice and interactive questions for the preliminary phase with the use of an ad-hoc software
- Open questions for the final.
- We produce and distribute a booklet with commented solutions to pupils and teachers (key to improve informatics perception from year to year)

Qualifying round

Kangourou
informatics

M. Monga

Informatics is
fun

The many facets
of informatics

Promoting
through
contests

Kangourou of
informatics

Qualifying round
Final round

Conclusions

- carried out on-line from schools, under the supervision of teachers
- Ad hoc software: keeps the time, collects the answers and sends them to the server for evaluation
- Participants may use the Web or other applications, if they want: the focus is not on the tools, but the use of a computer application is important to keep the link explicit (yes, it is a computer science game!)
- Challenges with different difficulty: easy, medium, difficult (nobody should be able to do everything, but everyone should solve something and get captured by most of the challenges)

Example

Conclusions

Riccardo has **two lists** of soccer teams, he wants to know which teams are in the first but not in the second. Riccardo may combine (by pipe and filters, we might say) three programs:

- ① catenate, which is able to append a list to a given one;
- ② dups, which returns a list of duplicates in a list;
- ③ uniqs, which returns a list of unique values in a list.

Two versions. Medie: **identify** a correct solution. Biennio: **build** a correct solution.

Example

Medie: identify the correct solution.

Squadre di calcio (3 punti)

Il piccolo Riccardo ha raccolto i nomi delle squadre di calcio che hanno partecipato ad almeno uno dei campionati passati e li ha messi nella lista "SquadreVecchie".

Poi ha messo nella lista "Squadre2011" l'elenco delle squadre partecipanti al campionato 2011.

Ora Riccardo vorrebbe sapere quali sono le squadre che partecipano per la prima volta, usando tre programmi di cui dispone il suo PC:

- un programma che attacca due o più liste una dopo l'altra;
- un programma che elenca gli elementi ripetuti in una lista;
- un programma che elenca gli elementi unici in una lista.

Ogni volta che un programma è eseguito, produce come risultato una nuova lista, senza modificare quella o quelle su cui ha operato.

In che modo Riccardo può utilizzare i programmi per ottenere il risultato voluto?

<input type="radio"/>	E' impossibile
<input type="radio"/>	Attacca "Squadre2011" e "SquadreVecchie"; trova nel risultato gli elementi ripetuti; li attacca a "Squadre2011"; elenca gli elementi unici di questa nuova lista
<input type="radio"/>	Attacca "Squadre2011" e "SquadreVecchie"; trova nel risultato gli elementi ripetuti; li attacca a "SquadreVecchie"; elenca gli elementi ripetuti di questa nuova lista
<input type="radio"/>	Attacca "Squadre2011" e "SquadreVecchie"; trova nel risultato gli elementi ripetuti; li attacca a "SquadreVecchie"; elenca gli elementi unici di questa nuova lista
<input type="radio"/>	Attacca "Squadre2011" e "SquadreVecchie"; trova nel risultato gli elementi unici; li attacca a "SquadreVecchie"; elenca gli elementi unici di questa nuova lista

Conclusions

Geomag (max 5 punti)

Gli allievi del dottor Kang si sfidano in un gioco di intelligenza. Compongono con il Geomag la costruzione di figura 1.

Lo scopo del gioco è ottenere tre quadrati come in figura 2 utilizzando i bastoncini e le biglie a disposizione. Vince chi compie il minor numero di mosse, contando come mossa ogni bastoncino spostato. Lo spostamento delle biglie non conta invece come mossa.

Meno modifiche farete più punti otterrete!

Figura 1

Qualifying round
Final round

Conclusions

Final round

- Final round in **Mirabilandia** (an amusement park near Rimini)
- 12 + 12 best qualified teams (at most one per school)
- Lessons and labs for teachers (while pupils play the game)
- Paper puzzles **and** computer based tasks
- Computers are available in “time sharing”: **every PC is shared between two teams**, teams are automatically logged out when a time slice is elapsed

Qualifying round
Final round

Conclusions

- The comments we collected from participants describe the experience as fun and challenging
- The choice of organizing the game around teams has a positive side effect: in order to be able to participate, pupils more focused on computers solicit friends with lesser interest, and the teams are indeed heterogeneously composed
- The best teams often show an interesting subdivision of roles (the “programmer”, the “logical thinker”, the “pony express”, the “checker”), some multi-threading of tasks and a good ability in avoiding downtime
- Positive feedback from the teachers: they also welcome the availability of the booklets, a good alternative to specialized literature (mostly out of reach) or commonplace ICT/business-oriented publications
